Microblot-Array

Multiplex diagnostics in microtiter plate format

ENG

Definition of efficient multiplex diagnostics

Microblot-Array is an immunoblot array in microtiter plate format designed for efficient multiplex diagnostics. The technology eliminates the bottleneck of traditional BLOT processing and capacity and opens up the way to high throughput testing and automation.

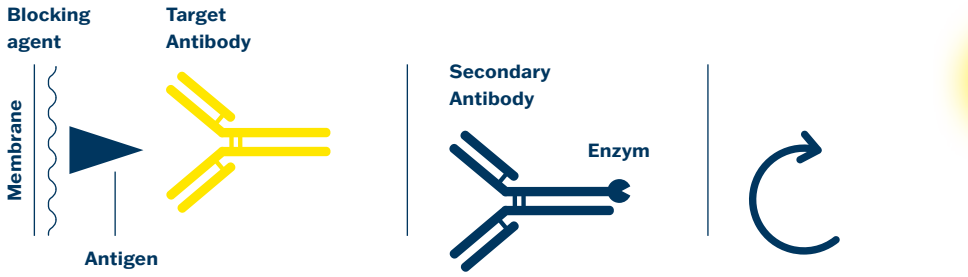
The comprehensive evaluation of Microblot Array testing is ensured by using the Microblot-Array Software in combination with the Microblot-Array Reader, enabling complex image analysis including results evaluation and connectivity to LIS.

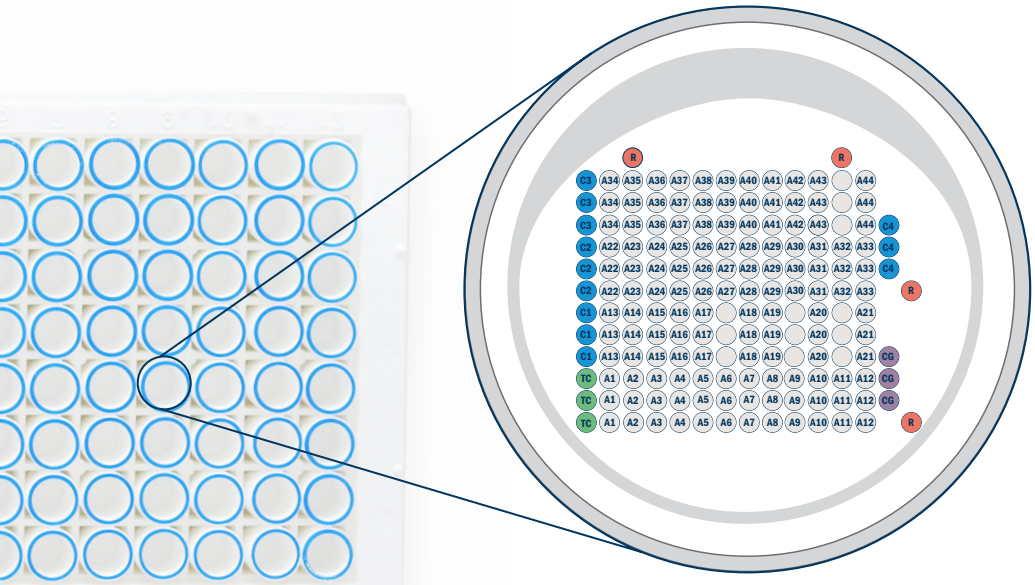
Main clinical areas covered

- Infectious serology
- Autoimmunity

Microblot-Array principle

Specific recombinant proteins/antigens spotted onto a nitrocellulose membrane





- **R** – Reference
- **TC** – Test control
- **CA** – Conjugate control IgA
- **CG** – Conjugate control IgG
- **CM** – Conjugate control IgM
- **C1** – Calibration 1
- **C2** – Calibration 2
- **C3** – Calibration 3
- **C4** – Calibration 4

Complex solution

Microblot-Array Software

- Automated test identification
- Intuitive and user-friendly guiding throughout the results evaluation
- Complex image analysis
- Optional manual control of spot localization
- Detailed results comparison within single wells and spots
- Evaluation of the validity test through control spots
- Export of results in various formats
- LIS connectivity

Calibration data

- Innovative processing and evaluation with LOT identification
- Calibration data ensure significant benefits:
  - Interchangeability of conjugate and substrate between the same Ig classes
  - Unification of evaluation criteria for all MBA kits
  - The more effective automatic processing

Microblot-Array

- Antigens spotted in triplicate – minimizing statistical variation
- Controls in each well
- 4 calibration spots to create a calibration curve
- Evaluation based on combination of positive antigen spots: qualitative, quantitative (U/ml)
- or semiquantitative (IP)

Microblot-Array Reader

- Fast high-quality scanning and evaluation: 5 min. per full plate
- Scanning of selected wells
- Automated spot localization and image analysis
- Optimized for a 96-well microtiter plates format

Benefits

Efficiency

- Analysis of up to 96 patient samples per plate
- Low sample consumption – 10 µl
- Parallel testing of multiple markers simultaneously
- Time and cost saving diagnostics

Automation

- Possibility of automated processing using an ELISA instrument
- Intuitive software for test evaluation
- Evaluation of individual antigens and their association with pathogen species or disease type

Flexibility

- One parameter × various parameters
- One well × high number of samples
- Manual processing × automated processing

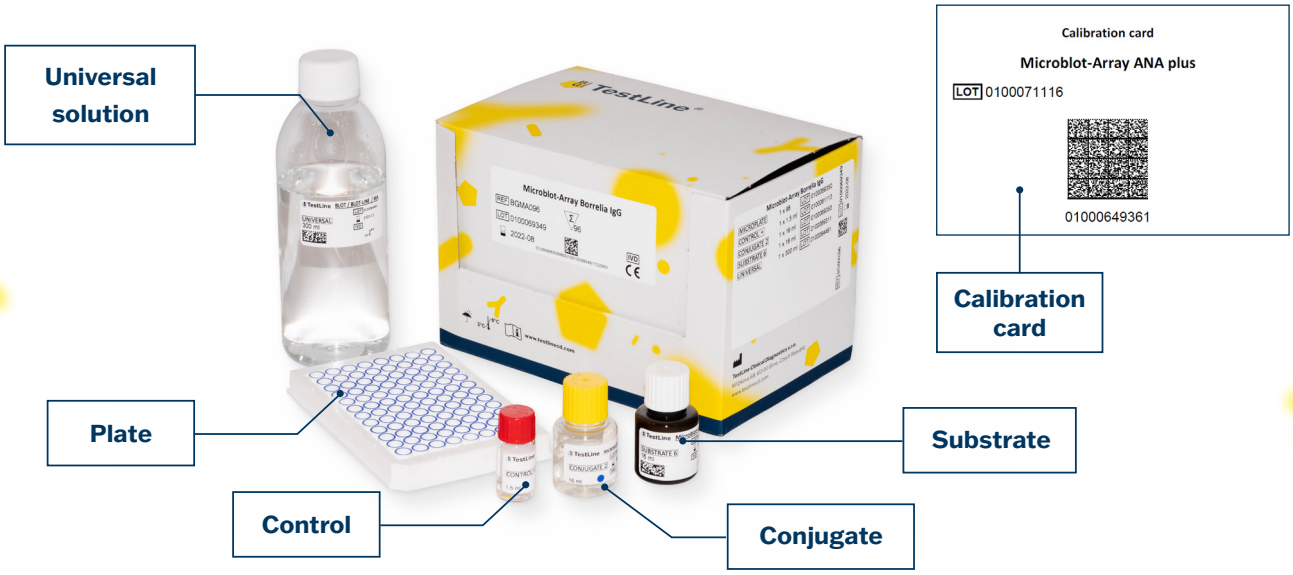
User comfort

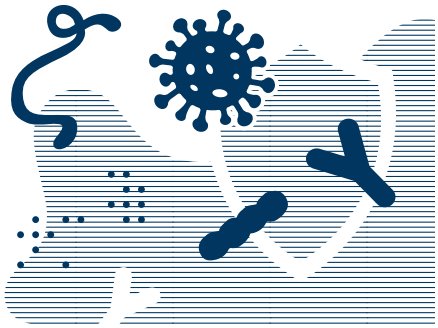
- Ready-to-use components
- Identical assay procedure (30–30–15 min.)
- Remote troubleshooting
- Reagents interchangeability due to batch identification (calibration data)

Automatic processing by ELISA analyzer minimizes hands-on time, eliminates errors rate due to the QR code identification system, and improves the throughput of samples.

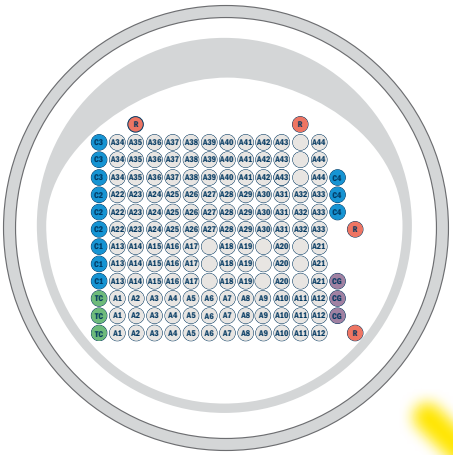
Protocol Summary

Step No.	Test steps
1.	Pipette Universal Solution – 150 µl
2.	Wells soaking at room temperature for 10 min.
3.	Aspirate off
4.	Dilute samples serum/plasma 1:51 (10 µl + 500 µl) cerebrospinal fluid 1:3 (50 µl + 100 µl) synovial fluid 1:17.5 (10 µl + 165 µl)
5.	Pipette control and diluted samples – 100 µl
6.	Incubate at room temperature for 30 min.
7.	Quick wash using the Universal Solution
8.	Aspirate and wash 3 × 5 min. with 150 µl of Universal Solution
9.	Pipette Conjugate – 100 µl
10.	Incubate at room temperature for 30 min.
11.	Quick wash using the Universal Solution
12.	Aspirate and wash 3 × 5 min. with 150 µl of Universal Solution
13.	Pipette Substrate Solution (BCIP/NBT) – 100 µl
14.	Incubate at room temperature for 15 min.
15.	Quick wash using the distilled water
16.	Aspirate and wash 2 × 5 min. with 200 µl of distilled water
17.	Dry and evaluate strips





Microblot-Array for the diagnostics of systemic autoimmune diseases



The main benefit of Microblot-Array ANA kits is the high number of antigens which can be simultaneously detected in one sample. The kits are primarily intended for confirmation of ELISA or other screening method. However, they also enable identification of specific antibody and thus differentiation of systemic autoimmune diseases, such as myositis, scleroderma, systemic lupus and others. The kits are optimized and validated for detection of specific IgG in human serum or plasma.

Test Characteristics

Parameters of the Microblot-Array ANA kit

	Diagnostic Sensitivity	Diagnostic Specificity
ANA	95.2% (n = 398)	95.3% (n = 148)

Comparative Study – Correlation of Results

Myopathy

n = 80	Microblot-Array	BLOT
positive	70	69
negative	0	0

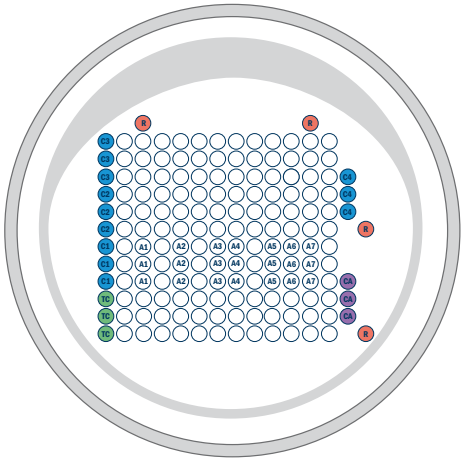
Microblot-array for the diagnostics of *Bordetella pertussis* and *Bordetella parapertussis*

Microblot-Array Bordetella kits provide the detailed determination of the presence of specific IgA, IgG, and IgM antibodies to recombinant Bordetella pertussis and Bordetella parapertussis antigens in human serum or plasma. It can be used for differentiation of postinfection and postvaccination antibodies as well as for differentiation disease stage. It confirms positive or borderline ELISA or agglutination test.



Test Characteristics

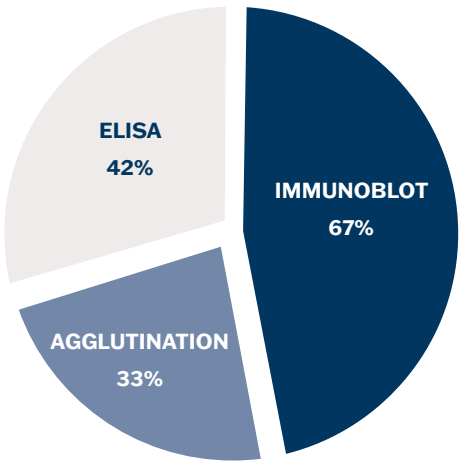
Parameters of Microblot-Array Bordetella kits

Pathogen	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array Bordetella pertussis IgA	95.4%	100.0%
Microblot-Array Bordetella parapertussis IgA	96.9%	100.0%
Microblot-Array Bordetella pertussis IgG	97.6%	100.0%
Microblot-Array Bordetella parapertussis IgG	97.1%	100.0%
Microblot-Array Bordetella pertussis IgM	95.4%	100.0%
Microblot-Array Bordetella parapertussis IgM	95.8%	100.0%

Spot No.	Antigen	Description	Pathogen
A1	PT	Pertussis toxin (45 kDa) – basic virulence factor, specific only for *B. pertussis*, the most important pertussis antigen	**Bordetella pertussis**
A2	FHA	*B. pertussis* filamentous hemagglutinin – adhesive protein, important immunogen; selected part of the sequence with high specificity	
A3	ACT	Adenylate cyclase toxin (CyaA) – significant virulence factor of *B. pertussis* with anti-phagocytic activity	
A4	TCF	Tracheal colonization factor – protein produced only by *B. pertussis*; adhesin; enabling the microorganism to adhere to mucosal surfaces of respiratory tract and colonize ciliated epithelial cells and phagocytes	
A5	Pertactin	75 kDa; outer membrane protein of virulent *B. parapertussis* strains	**Bordetella parapertussis**
A6	FimN	Fimbriae N – adhesin, non-produced by *B. pertussis*	
A7	EntA	Entericidin A – membrane lipoprotein	

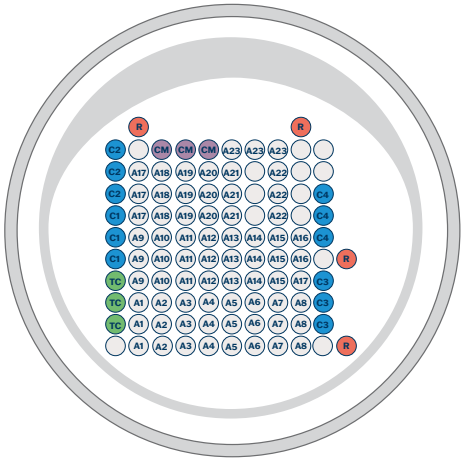
Clinical Data

Laboratory detection of acute infection in a group of patients with clinical diagnosis of pertussis (n= 25 paired samples)



Microblot-Array for the diagnostics of *Borrelia* species and *Anaplasma phagocytophilum*

The kits are optimized for the detection of specific IgG and IgM antibodies to recombinant antigens of *Borrelia* species and *Anaplasma phagocytophilum* (HGA) in human serum, plasma, cerebrospinal or synovial fluid.



Serological diagnostics of borreliosis is difficult due to the large genetic diversity of the species *Borrelia burgdorferi s.l.*, possible cross reactivity with unrelated antigens of other microorganisms (p44, OmpA, TpN17 and VCA-p18), and borrelia richness to heat shock proteins. Diagnostics is also complicated due to various individual serological reactivity. The production of antibodies can be extremely slow in the early phase of the disease. On the other hand, the IgG and IgM antibodies can persist for more than ten years. The Microblot-Array Borrelia kits help to refine the diagnostics thanks to the high number of antigens present in one single test.

Test characteristics

Parameters of Microblot-Array Borrelia IgG (tested on sera)

	Diagnostic Sensitivity	Diagnostic Specificity
Borrelia IgG	97.3% (n = 74)	98.0% (n = 100)
Anaplasma IgG	92.0% (n = 25)	100.0% (n = 30)
Treponema	98.3% (n = 59)	100.0% (n = 30)

Parameters of Microblot-Array Borrelia IgM (tested on sera)

	Diagnostic Sensitivity	Diagnostic Specificity
Borrelia IgM	94.6% (n = 56)	95.8% (n = 95)
Anaplasma IgM	95.0% (n = 20)	100.0% (n = 38)
EBV	100.0% (n = 39)	98.0% (n = 51)

Comparative Study

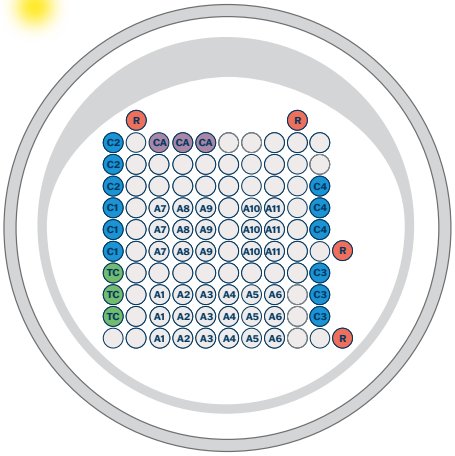
Microblot-Array for the diagnostics of *Chlamydia* species



Microblot-Array Chlamydia are kits designed for the confirmation of positive or cut-off results of samples which were previously screened by ELISA or other serological methods. They serve for the detection of specific IgA and IgG antibodies to recombinant antigens of *Chlamydia* species in human serum or plasma. Thanks to the complex antigen composition they can be used for determination of particular species.

Spot No.	Antigen	Description	Pathogen
A1	MOMP Cp	Dominant major outer membrane protein (species specific) – structural protein; metabolic function	***Chlamydia pneumoniae***
A2	MOMP1	MOMP isoform, produced by posttranslational modification	
A3	OMP2 Cp	Outer membrane protein (species specific) – structural protein of Chlamydia outer membrane complex	
A4	OMP4	Outer membrane protein	
A5	OMP5	Outer membrane protein	
A6	P54	Immunodominant outer antigen, highly specific to *Ch. pneumoniae* – sensitive marker for diagnosis of acute infection	
A7	MOMP Ct	Dominant major outer membrane protein (species specific) – structural protein; metabolic function	***Chlamydia trachomatis***
A8	OMP2 Ct	Outer membrane protein (species specific) – structural protein of *Chlamydia trachomatis* *Chlamydia* outer membrane complex	
A9	HSP60	Heat shock protein (GroEL); marker of chronic infection

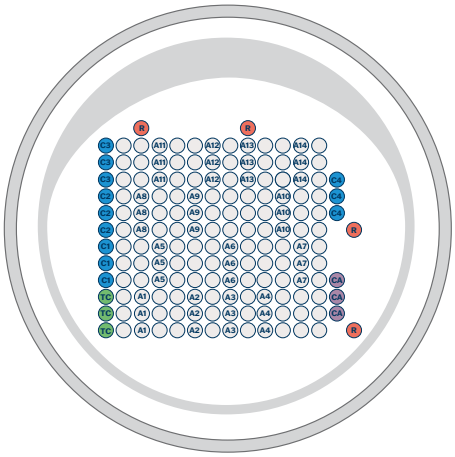
Microblot-Array for the diagnostics of SARS-CoV-2 and other coronaviruses

Microblot-Array COVID-19 kits enable simultaneous detection of multiple SARS-CoV-2 markers (NP, RBD, Spike S1, Spike S2, Spike S1 α-variant, Spike S1 γ-variant, Spike S1 δ-variant, E, ACE2, and PLPro). The kits also contain antigens to exclude cross-reactivities with other endemic coronaviruses (MERS-CoV, SARS-CoV, etc.). The kit contains antigens for the detection of various α, γ, δ mutations. The kits are optimized and validated for detection of IgA, IgG and IgM antibodies in human serum or plasma. They can be used for confirmatory testing, screening, epidemiological studies, identification of donors for convalescent plasma therapy, and other IVD and research applications related to the novel coronavirus.



Spot No.	Antigen	Description	Pathogen
A1	Nucleocapsid NP	A potent immunodominant coronavirus antigen that contains diagnostically important epitopes for the diagnosis of SARS-CoV-2 Sensitive detection of anti-SARS-CoV-2 IgG antibodies	SARS-CoV-2
A2	RBD	Receptor-binding domain of the S1 subunit of the spike (S) protein of SARS-CoV-2 Anti-RBD SARS-CoV-2 antibodies are highly subtype specific and protective The presence of anti-RBD antibodies significantly correlates with the formation of neutralizing antibodies IgA: for monitoring the immune response after a positive PCR reaction; indicator of the onset of the immune response IgM, IgG: detection of antibodies from 2 to 4 weeks after infection	
A3	Spike S1	The S1 subunit of the SARS-CoV-2 spike protein contains a receptor-binding domain (RBD), through which the virus binds to the surface of the host cell Anti-S1 antibodies are highly subtype specific, showing high sensitivity against SARS-CoV-2 and are protective	
A4	Spike S2	S2 subunit of the spike protein SARS-CoV-2 Plays an important role in the fusion of the virus with the cell membrane	
A5	Spike S1 α-variant	British mutation , Spike Glycoprotein S1 (B.1.1.7)	
A6	Spike S1 γ-variant	Brazilian mutation, Spike Glycoprotein S1 (P.1)	
A7	Spike S1 δ-varianta	Indian mutation, Spike Glycoprotein S1 (B1.617.2)	
A8	Envelope protein (E)	The smallest major structural protein Important for different stages of viral infection and replication, important role in the life cycle of the virus	

Spot No.	Antigen	Description	Pathogen
A9	ACE2	Angiotensin Converting Enzyme (transmembrane glycoprotein) A key component of the renin-angiotensin system Expressed in vascular endothelial cells in the heart, kidneys, but also the testes, liver, intestines, lungs and also the brain Involved in the regulation of cardiovascular and renal function	**Human receptor**
A10	PLpro	Papain-like protease One of the basic SARS-CoV-2 proteins, essential for virus replication; deubiquitination activity Necessary for proteolysis of the viral polyprotein	**SARS-CoV-2**
A11	MERS-CoV S1	Middle East Respiratory Syndrome Coronavirus S1 protein	**Other endemic coronaviruses**
A12	SARS-CoV Np	Severe Acute Respiratory Syndrome Coronavirus Nucleocapsid protein	
A13	HCoV 229E Np	Human coronavirus 229E Nucleocapsid protein	
A14	HCoV NL63 Np	Human coronavirus NL63 Nucleocapsid protein	

Test characteristics

Parameters of Microblot-Array COVID-19 kits

	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array COVID-19 IgA	98.3% (n = 233)	96.2% (n = 593)
Microblot-Array COVID-19 IgG	98.7% (n = 309)	99.3% (n = 600)

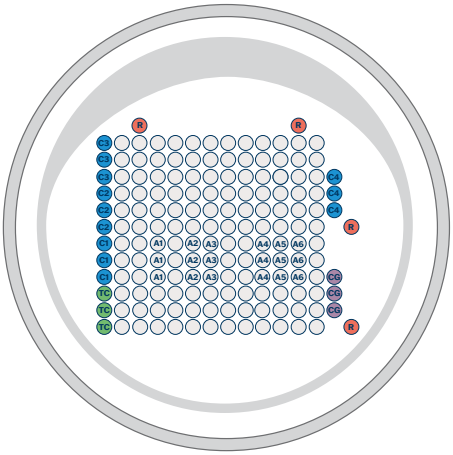
Microblot-Array for the diagnostics of cytomegalovirus infection

The Microblot-Array CMV kit is a new generation kit exhibiting a high diagnostic sensitivity and specificity and enabling quantitative evaluation. It is intended for confirmatory determination of specific antibodies in samples identified as positive or borderline by EIA or other serological tests. It is also intended to determine the presence of specific antibodies against CMV antigens, which allows to distinguish whether the primary infection is in an early or late stage or whether it is a secondary infection or reactivation.



Test characteristics

Parameters of Microblot-Array CMV kits

	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array CMV IgG	98.1%	99.9%
Microblot-Array CMV IgM	96.9%	99.1%

Spot No.	Antigen	Description
A1	p150	Tegument protein UL32 A strong immunogen of the late stage of infection (late antigen); it does not develop in the early stage. Detectable in the IgG class in higher titres even in reactivation.
A2	IEA (p72)	Immediate early antigen, capsid protein UL123 Plays a role in the early phase of the replication cycle of human CMV Important function in defence mechanisms against CMV infection
A3	p65	Tegument protein UL83 In the IgM class – one of the markers of the early stage of infection In the IgG class – rather typical for the late stage or infection reactivation
A4	p52	CM2 protein; UL44 In the IgM class – an important marker of the early stage of primary infection In the IgG class – reactivity rather in the late stage, or infection reactivation
A5	p28	Tegument protein UL99 A strong immunogen: it may develop in late stages of infection
A6	gB	Membrane glycoprotein B Antibody response in IgG class – approximately 50–100 days after primary infection

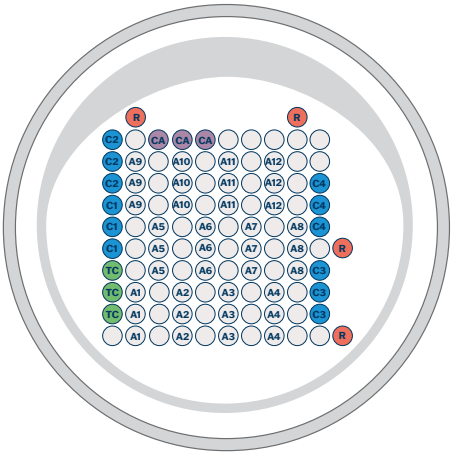
Microblot-Array for the diagnostics of Epstein-Barr virus



Microblot-Array EBV kits are optimized and validated for detection of IgA, IgG and IgM antibodies in human serum or plasma. The kits are intended for confirmatory determination of specific antibodies in samples that have been identified mainly as positive or borderline by ELISA or other serological tests. Determination of specific class antibodies against EBV antigens is a useful tool for identifying a stage of EBV infection (primary infection, latent chronic infection or reactivation).

Spot No.	Antigen	Description
A1	EBNA-1	Epstein-Barr nuclear antigen 1 IgG: an important diagnostic marker of the late phase or reactivation of the infection IgM: the antibodies are detectable 2–4 months after primary EBV infection, they may also appear during reactivation
A2	EBNA-2	Epstein-Barr nuclear antigen 2 IgG: high antibody titres are present during chronic infection or in the post-acute phase The absence of IgG anti-EBNA-2 antibodies and the presence of anti-EBNA-1 antibodies rules out primary infection
A3	VCA p18	Viral Capsid Antigen p18; IgA: marker of primary infection; high titres persist in patients with nasopharyngeal carcinoma IgM: marker of primary infection; they may also be present during infection reactivation IgG: an important marker of the late phase of the infection, antibodies do not occur in primary infections
A4	VCA p23	Viral Capsid Antigen p23 Antibodies against this antigen can be detected during all phases of the infection (both IgG and IgM), they persist in the body for a long time
A5	EA-D p54	Early Antigen Diffuse p54; BMRF1 IgA: produced during primary infection; high titres during reactivation; high titres persist in patients with nasopharyngeal carcinoma An additional marker of acute EBV infection, detectable even in the latent phase of primary infection (both IgG and IgM)
A6	EA-D p138	Early Antigen Diffuse p138 IgA: produced during primary infection; high titres during reactivation; high titres persist in patients with nasopharyngeal carcinoma An additional marker of acute EBV infection, detectable even in the latent phase of primary infection (both IgG and IgM)
A7	EA-R	Early Antigen Restricted protein p85; IgG: antibodies usually occur at a later stage; they are practically absent during the acute phase except in children; high levels in patients with reactivation or in immunocompromised patients
A8	Rta	Replication and transcription Activator (BRLF1); A very early antigen IgG: a potential diagnostic marker of a nasopharyngeal carcinoma

Spot No.	Antigen	Description
A9	ZEBRA	Z Epstein-Barr replication activator protein; Trans-activator protein BZLF1 IgM: it is a very early indicator of an acute infection IgG: it is an early stage marker but it is also detectable during the late stages of the infection Serological marker of EBV reactivation, marker of EBV-associated diseases
A10	gp85	Probable membrane antigen gp85 (BDLF3);
A11	gp350	Epstein-Barr virus envelope glycoprotein gp350 (BLLF1); IgM: high titres in patients with infectious mononucleosis IgG: the titre increases only a few months after the primary infection Specific immune response for EBV-associated diseases
A12	LMP1	Latent membrane protein 1 Frequent in latent infections Linked to EBV-associated malignancies (nasopharyngeal carcinoma)

Test characteristics

Parameters of Microblot-Array EBV kits

	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array EBV IgA	98.9% (n = 167)	96.7% (n = 70)
Microblot-Array EBV IgG	98.8% (n = 167)	96.9% (n = 70)
Microblot-Array EBV IgM	96.4% (n = 61)	89.3% (n = 60)

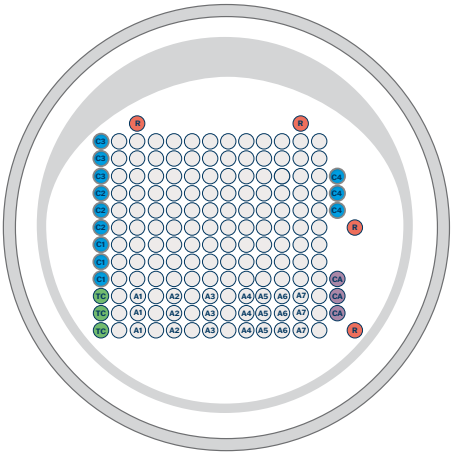
Microblot-Array for the diagnostics of *Helicobacter pylori* infection



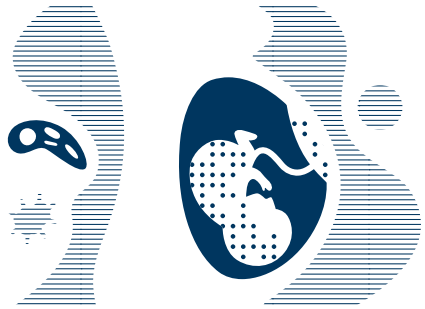
The kits are optimized and validated for the detection of IgA and IgG antibodies against recombinant antigens *Helicobacter pylori* in human serum. For confirmation of ELISA positive or ambiguous results.

Test Characteristics

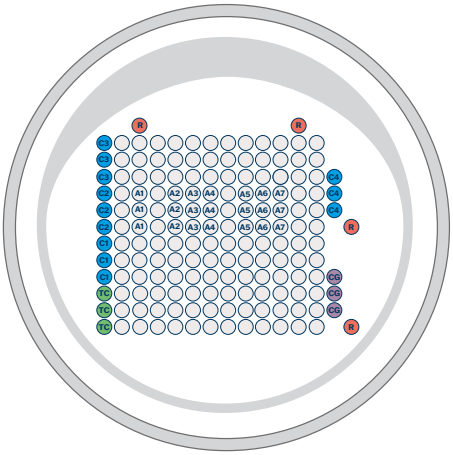
Parameters of Microblot-Array Helicobacter pylori kit

	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array Helicobacter IgA	96.5%	99.1%
Microblot-Array Helicobacter IgG	97.4%	99.0%

Spot No.	Antigen	Description
A1	CagA, p120	Cytotoxin associated gene A, highly specific, virulence factor
A2	VacA, p87	Vacuolating cytotoxin A, highly specific, virulence factor
A3	UreA, p29	Light subunit of urease, specific, virulence factor
A4	NAP	Neutrophil-activating protein, virulence factor, potential biomarker of gastritis
A5	HpaA	Helicobacter pylori adhesin A, surface lipoprotein, potential biomarker of gastritis and gastric ulcer
A6	HcpC	Helicobacter cystein-rich protein, virulence factor
A7	GroEL	Chaperonin, heat shock protein (Hsp 60), virulence factor, considered as a marker of chronic infection



Microblot-Array for the diagnostics of *Herpes simplex virus* infection



The Microblot-Array HSV kit is a new generation kit exhibiting a high diagnostic sensitivity and specificity and enabling quantitative evaluation. It is intended for confirmatory determination of specific antibodies in samples identified as positive or borderline by EIA or other serological tests. It is also intended to determine the presence of specific antibodies against HSV 1+2 antigens, which allows to distinguish whether the primary infection is in an early or late stage or whether it is a secondary infection or reactivation.

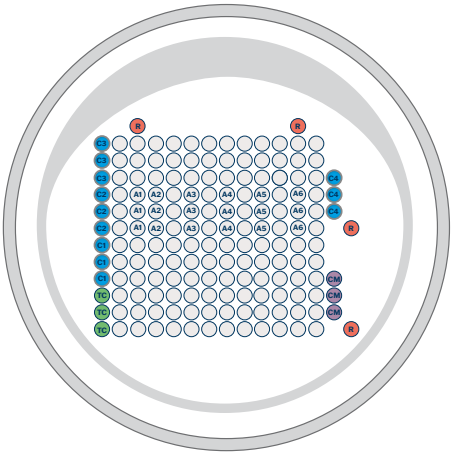
Test Characteristics

Parameters of Microblot-Array HSV kits

	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array HSV 1+2 IgG	99.9%	97.5%
Microblot-Array HSV 1+2 IgM	95.0%	99.4%

Spot No.	Antigen	Description
A1	HSV 1+2	Native HSV-1and HSV-2 antigen
A2 A3	gC-1 gC-2	Glycoprotein C-1 specific for *Herpes simplex 1 virus*; Glycoprotein C-2 specific for *Herpes simplex 2 virus*; Early antibody production
A4 A5	gD-1 gD-2	Glycoprotein D-1 specific for *Herpes simplex 1 virus*; Glycoprotein D-2 specific for *Herpes simplex 2 virus* serves to capture and entry of the virus into a potential host cell; stimulates high production of neutralizing antibodies, high similarity between HSV-1 and -2
A6 A7	gG-1 gG-2	Glycoprotein G-1 specific for *Herpes simplex 1 virus*; Glycoprotein G-2 specific for *Herpes simplex 2 virus* Appropriate for differentiating between HSV-1 and -2 infection In the IgG class – indications of previous or probably latent infection; antibodies are formed only in the convalescent phase, they have been found also in patients with reactivation of infection In the IgM class – antibodies are produced only in the convales

Microblot-array for the diagnostics of *Mycoplasma* infection



Microblot-Array Mycoplasma kits are used for the detection of specific IgA and IgG antibodies against recombinant antigens of *Mycoplasma pneumoniae* in human serum or plasma. Intended use is for confirmation of EIA ambiguous or positive results.

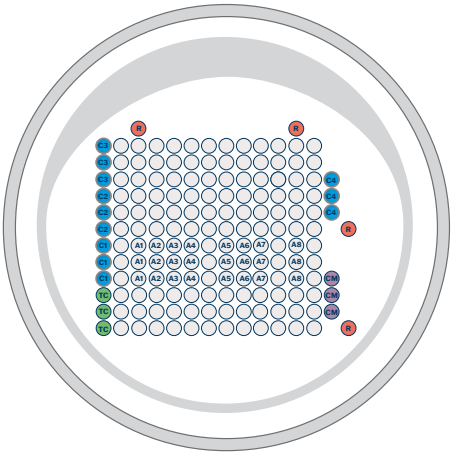
Test Characteristics

Parameters of Microblot-Array Mycoplasma pneumoniae

	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array Mycoplasma IgA	97.1%	99.3%
Microblot-Array Mycoplasma IgG	95.7%	99.0%
Microblot-Array Mycoplasma IgM	98.9%	99.3%

Spot No.	Antigen	Description
A1	P1	Adhesin; the most important protein, a major virulence factor
A2	p30	Cytadhesin p30; the second most important protein, a major virulence factor
A3	p116	Adhesin, a major virulence factor
A4	p65	Surface protein; proline-rich P65 protein
A5	HMW3	Cytadherence high molecular weigh 3; adhesion-promoting protein
A6	Mgp3	Adhesion-promoting protein

Microblot-Array for the diagnostics of *Yersinia* infection



The kits are suitable for the detailed determination of anti-Yersinia species specific IgA and IgG antibodies in human serum or plasma. Confirmation of ELISA positive or ambiguous results.

Test Characteristics

Parameters of Microblot-Array Yersinis sp.

	Diagnostic Sensitivity	Diagnostic Specificity
Microblot-Array Yersinia IgA	96.1%	99.9%
Microblot-Array Yersinia IgG	95.5%	99.9%

Spot No.	Antigen	Description
A1	YopB	Yersinia outer protein, transmembrane protein
A2	YopD	Yersinia outer protein, transmembrane protein
A3	YopM	Yersinia outer protein
A4	YopN	Yersinia outer protein
A5	LcrV	Low calcium response Virulence, important for YopD a YopB secretion
A6	Ail	Attachment-invasion locus protein early phase, involved in the adhesion and invasion process, allows yersinia to survive outside the host cell, a significant virulence factor
A7	Invasin	Surface adhesin binding to β1 integrins on surface of target cells; important in the first stage of infection, a virulence factor
A8	YscM-Y.Ent	Yop proteins translocation protein M

Microblot-Array kits in development

Gastrointestinal diseases

Kit	Antigens/parameters	Availability
Microblot-Array Autoimmune gastroenteritis IgA, IgG	ASCA, DAG, tTG, IF, APCA, MPO	2023
Microblot-Array Gastro panel IgA, IgG	Helicobacter pylori, Yersinia enterocolitica, Autoimmune gastroenteritis	In development

Herpetic infections

Kit	Antigens/parameters	Availability
Microblot-Array Herpetic infections panel IgG, IgM	EBV, CMV, HSV, VZV, HHV-6	In development

Liver-Kidney diseases

Kit	Parameters	Availability
Microblot-Array Liver-Kidney profile	3E (BPO), M2, Sp100, PML, gp210, LKM-1, LC-1, SLA/LP, Ro52, ASGPR, Nup62, OGDC-E2, PDC-E2	2023

Atypical respirations

Kit	Parameters	Availability
Microblot-Array Atypical respirations panel IgA, IgG, IgM	Mycoplasma pneumoniae, Bordetella sp., Chlamydia pneumoniae, Legionella pneumophila	In development

Autoimmune neurological diseases

Kit	Antigens	Availability
Microblot-Array Paraneoplastic syndrome	Amphysin, CV2, GAD65, Hu, MA1, MA2, MAG, Recoverin, Ri, SOX1, Titin, Tr, Yo, ZIC4, AChR, MusK, Aquaporin-4	In development
Microblot-Array Limbic encephalitis	LGI1, CASPR2, NMDAR, AMPA1/2, GABA1/2	In development

Anti-neutrophil cytoplasm antibodies

Kit	Antigens	Availability
Microblot-Array ANCA	PR3, MPO, GMB*	In development

*Other antigens will be added later.

Tropical diseases

Kit	Parameters	Availability
Microblot-Array Tropical diseases panel	Dengue, Chikungunya, Zika, West Nile Fever, Plasmodium, Rickettsia, Leptospira	In development

Vector transmitted infections

Kit	Parameters	Availability
Microblot-Array Vector transmitted infections panel	Rickettsia, Babesia, Anaplasma phagocytophilum, Neoehrlichia (Candidatus Neoehrlichia mikurensis), TBEV, Borrelia burgdorferi, Francisella tularensis, Q-fever (Coxiella burnetti)*	In development

*Kit composition will be more specified later

Endocrine antibodies

Kit	Antigens/parameters	Availability
Microblot-Array Thyreoid disease	TPO, TSH, TG	In development
Microblot-Array Diabetes mellitus Type I	ICA, IAA, IA-2, GAD, ZnT8	In development
Microblot-Array Endocrine antibodies	Thyreoid disease, Diabetes mellitus Type I	In development

TORCH

Kit	Parameters	Availability
Microblot-Array TORCH panel	Toxoplasma, Rubella, CMV, HSV 1+2	In development

* Expected availability may change, there may be a slight changes in antigenic composition.
Status „In development“ does not guarantee final launch of the product.

Ordering information

All kits are *CE* and *IVD* certified.

Hardware a Software

Code	Products
ARCXIX096	Microblot-Array Reader (Array Reader C-series) + Software

Components

Code	Products
000008262	Universal Solution (300 ml)*

*In the case of automated processing, an additional universal solution is required because of the dead volumes of the instruments.
We recommend 2 extra bottles/kit (when running one plate per week). Please contact our sales representatives for more information.
